Soil Nitrogen

## Poor Crop Health

Overall, your crop health looks poor.

There are some improvement areas under nitrogen and water stress.

Based on the level of crop cover we can see; soil moisture is at 10% of optimum. The problem level is severe. We would recommend watering the field a lot more.

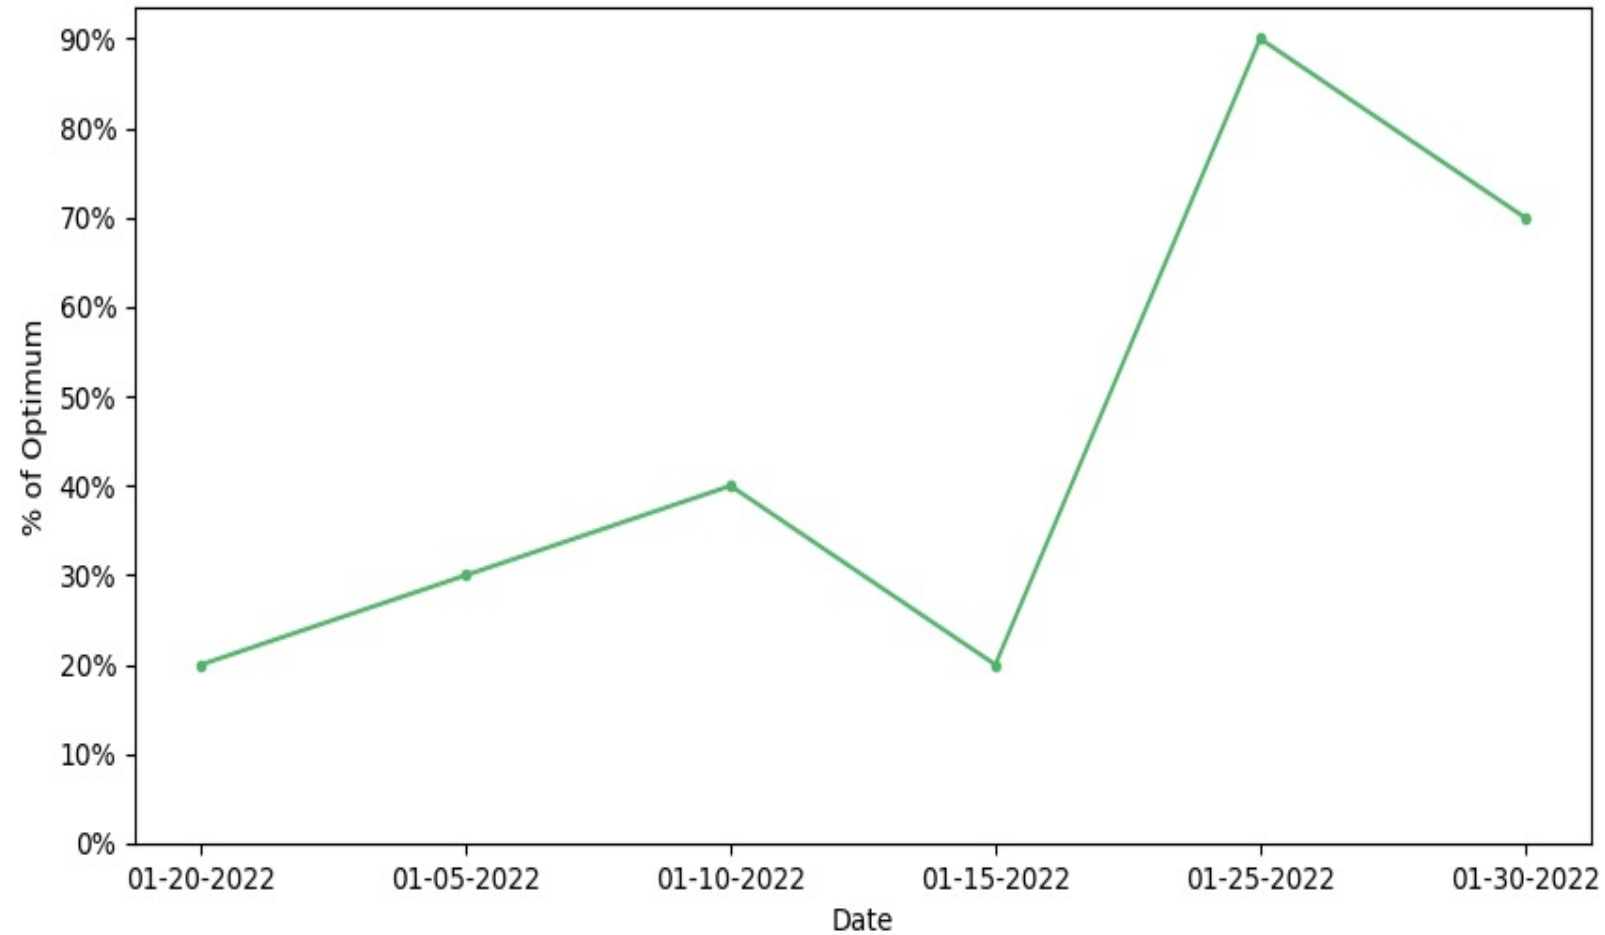

Soil nitrogen content is at 30% of optimum. This problem is severe. We would recommend calling our agronomist through the app to get advice on this matter. You can also calculate optimum levels of fertiliser through our app's Fertiliser Calculator feature.

**Urgent action needed!**

For maps to guide you to problem areas, please check the Satellite Explorer page in the GreenSat App.
